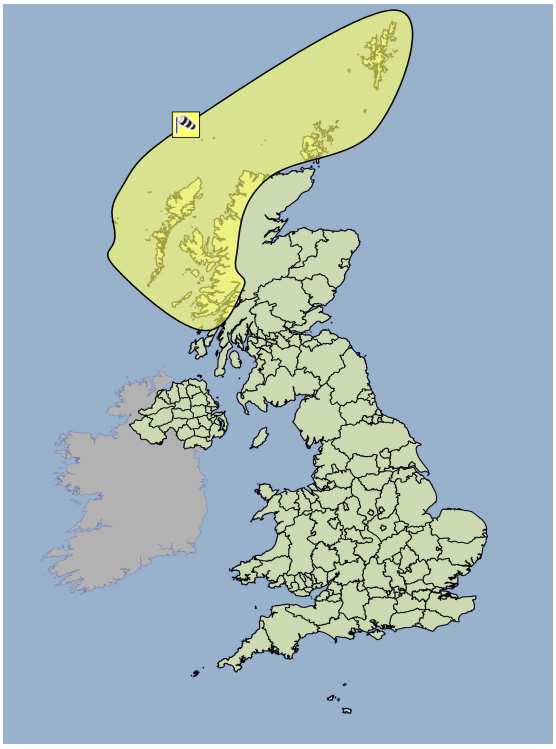
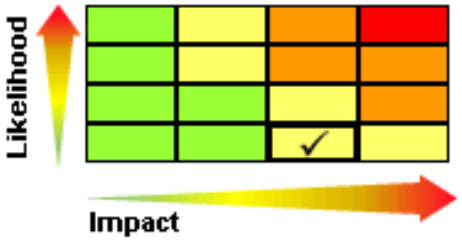
National Severe Weather Warning Service





Chief Forecasters Assessment
Another very vigorous area of low pressure is currently passing to the northwest of Britain, fortunately far enough away to steer its core of intense winds away from UK land areas. Nevertheless, another period of very strong winds, along with an active squally cold front, will lead to some difficult conditions across the northwest corner of the British Isles during the next few hours.

The Met Office have issued a **Yellow Warning** of **Wind**

Valid from **10:00 on Sun, 15th Dec 2013** until **17:00 on Sun, 15th Dec 2013**

Another spell of very windy weather is expected across the north and northwest of Scotland on Sunday. There is potential for southerly gusts of 70 mph in places, perhaps locally to around 80 mph in exposed parts of the Western Isles.

Large waves, particularly around times of high tide, may overtop exposed coasts and causeways.

This is an update to yesterday's warning, with peak wind gusts now expected to be a little lower. However the public should be aware of the risk of localised disruption to transport.
